Intro

Intro

- this talk is about

Intro

- this talk is about
  - a `Dotty` *library* `PDBP`

Intro

- this talk is about
    - a `Dotty` *library* `PDBP`
    - inspired by the *function-level programming language* `FP`

John Backus

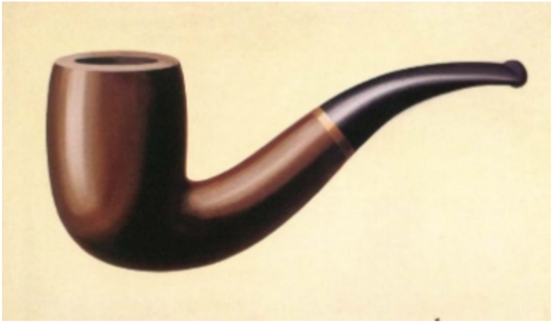
John Backus

- ACM Turing Award Winner 1977

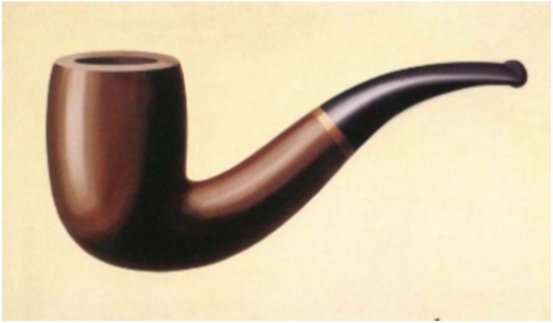
John Backus

- ACM Turing Award Winner 1977
- *Can programming be liberated from the Von Neumann style?*

What is this?

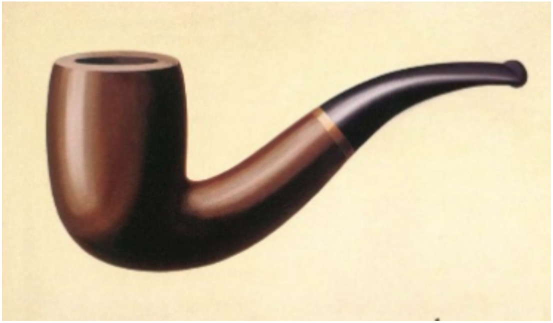


What is this?



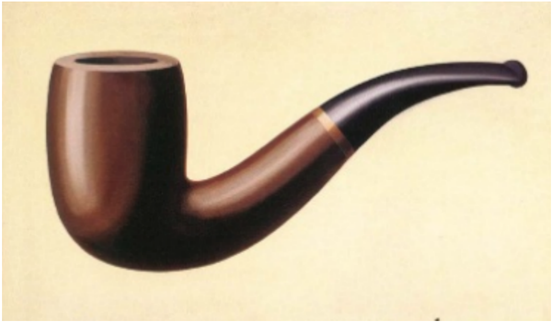
- A *pipe*?

What is this?



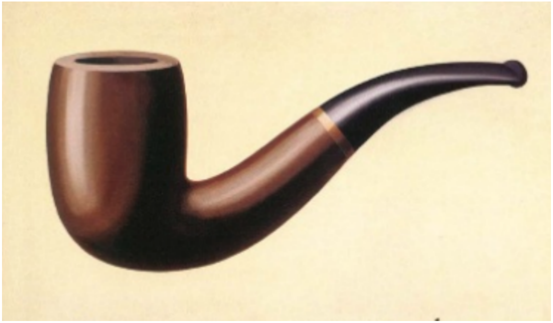
- A *pipe*?
- A painting *describing* a pipe?

What is this?



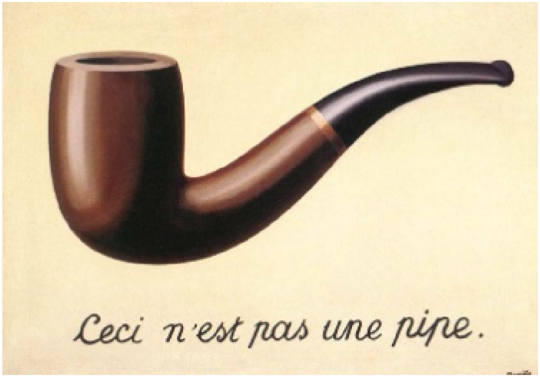
- A *pipe*?
- A painting *describing* a pipe?
- A slide *describing* a painting describing a pipe?

What is this?

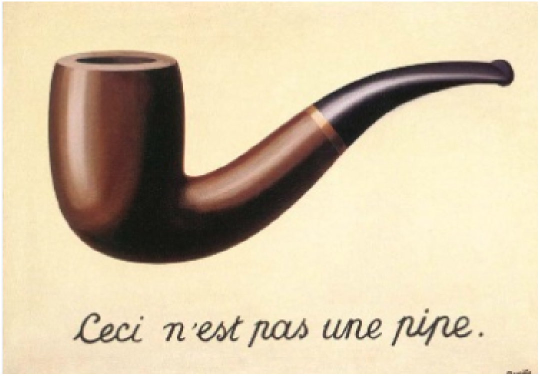


- A *pipe*?
- A painting *describing* a pipe?
- A slide *describing* a painting describing a pipe?
- ...

Ceci n'est pas une pipe



Ceci n'est pas une pipe



- It is a painting by René Magritte *describing* a pipe

This is not a program

```
val program: BigInt >--> BigInt =
  ‘if‘(isZero) {
    one
  } ‘else‘ {
    ‘let‘ {
      subtractOne >-->
        program
    } ‘in‘ {
      multiply
    }
  }
```

This is not a program

```
val program: BigInt >--> BigInt =
  `if`(isZero) {
    one
  } `else` {
    `let` {
      subtractOne >-->
        program
    } `in` {
      multiply
    }
  }
```

- It is `Dotty` code *describing* a program

This is not a program

```
val program: BigInt >--> BigInt =
  ‘if‘(isZero) {
    one
  } ‘else‘ {
    ‘let‘ {
      subtractOne >-->
        program
    } ‘in‘ {
      multiply
    }
  }
```

- It is `Dotty` code *describing* a program
- It is a *program description*

This is not a program

```
val program: BigInt >--> BigInt =
  `if`(isZero) {
    one
  } `else` {
    `let` {
      subtractOne >-->
        program
    } `in` {
      multiply
    }
  }
```

- It is `Dotty` code *describing* a program
- It is a *program description*
- Can you think of a more meaningful name?

Program Description

Program Description

- by abuse of notation we are simply going to write *program* instead of *program description*

Program Description

- by abuse of notation we are simply going to write *program* instead of *program description*
- we hope that this will not lead to any confusion

Type class `Program`

```
trait Program[>-->[- _, + _]]
```

factorial program

```
val factorial: BigInt >--> BigInt =
  ‘if‘(isZero) {
    one
  } ‘else‘ {
    ‘let‘ {
      subtractOne >-->
        factorial
    } ‘in‘ {
      multiply
    }
  }
```

factorial program

```
val factorial: BigInt >--> BigInt =
  ‘if‘(isZero) {
    one
  } ‘else‘ {
    ‘let‘ {
      subtractOne >-->
        factorial
    } ‘in‘ {
      multiply
    }
  }
```

- `factorial` *definition* uses
  the capabilities *declared* in `Program`

factorial implementations

```
val factorial: BigInt >--> BigInt =
  ‘if‘(isZero) {
    one
  } ‘else‘ {
    ‘let‘ {
      subtractOne >-->
        factorial
    } ‘in‘ {
      multiply
    }
  }
```

factorial implementations

```
val factorial: BigInt >--> BigInt =
  `if`(isZero) {
    one
  } `else` {
    `let` {
      subtractOne >-->
        factorial
    } `in` {
      multiply
    }
  }
```

- `factorial` *implementations* depend on `implicit object`'s *defining* the capabilities of `Program`

factorial meanings

```
val factorial: BigInt >--> BigInt =
  ‘if‘(isZero) {
    one
  } ‘else‘ {
    ‘let‘ {
      subtractOne >-->
        factorial
    } ‘in‘ {
      multiply
    }
  }
```

`factorial` meanings

```
val factorial: BigInt >--> BigInt =
  `if`(isZero) {
    one
  } `else` {
    `let` {
      subtractOne >-->
        factorial
    } `in` {
      multiply
    }
  }
```

- `factorial` *meanings* use
  natural transformations transforming implementations

program

```
val program: Z >--> Y
```

Composition

```
val ‘z>-->y‘: Z >--> Y
val ‘y>-->x‘: Y >--> X

val ‘z>-->x‘: Z >--> X = ‘z>-->y >--> ‘y>-->x‘
```

`program`
(design artifact)

```
 ---------------------------------
|  ----------        ----------  |
| | Z >--> Y | >--> | Y >--> X | |
|  ----------        ----------  |
 ---------------------------------
               ||
               \/
           ----------
          | Z >--> X |
           ----------
```

`mainProgram`

```
val program: Unit >--> Unit
```

mainProgram

```
val producer: Unit >--> Z
val program: Z >--> Y
val consumer: Y >--> Unit

val mainProgram: Unit >--> Unit =
  producer >--> program >--> consumer
```

`mainProgram`
(architectural artifact)

```
 ------------------------------------------------
|  ----------------    ----    ----------------  |
| | Unit >--> Unit |-| ???? |-| Unit >--> Unit | |
|  ----------------    ----    ----------------  |
 ------------------------------------------------
                       ||
                       \/
                ----------------
               | Unit >--> Unit |
                ----------------
```

FP versus PDBP

FP versus PDBP

- FP and PDBP

FP versus PDBP

    PDBP *effects* are *pure*

Homogeneous

Homogeneous

- programs are objects

Homogeneous

- programs are objects
    - programming using `PDBP` is all about
      passing around programming capabilities

Semantics

```
val factorial: BigInt >--> BigInt =
  `if`(isZero) {
    one
  } `else` {
    `let` {
      subtractOne >-->
        factorial
    } `in` {
      multiply
    }
  }
```

Semantics

```
val factorial: BigInt >--> BigInt =
  ‘if‘(isZero) {
    one
  } ‘else‘ {
    ‘let‘ {
      subtractOne >-->
        factorial
    } ‘in‘ {
      multiply
    }
  }
```

- *production*

Semantics

```
val factorial: BigInt >--> BigInt =
  `if`(isZero) {
    one
  } `else` {
    `let` {
      subtractOne >-->
        factorial
    } `in` {
      multiply
    }
  }
```

- *production*
  - *recursion* using *stack*

Semantics

```
val factorial: BigInt >--> BigInt =
  `if`(isZero) {
    one
  } `else` {
    `let` {
      subtractOne >-->
        factorial
    } `in` {
      multiply
    }
  }
```

- *production*
    - *recursion* using *stack*
    - *recursion* using *heap*

Semantics

```
val factorial: BigInt >--> BigInt =
  `if`(isZero) {
    one
  } `else` {
    `let` {

Foundations

Foundations

- `trait Program[>-->[- _, + _]]`
  corresponds to *arrows*

Foundations

- `trait Program[>-->[- _, + _]]`
  corresponds to *arrows*
- `trait Computation[C[+ _]]`
  corresponds to *monads*

Arrows versus monads

Arrows versus monads

- arrows generalize *functions*

Arrows versus monads

- arrows generalize *functions*
- *composition* based, *pointfree* functional programming

Arrows versus monads

- arrows generalize *functions*
- *composition* based, *pointfree* functional programming
- `val ‘z=>x‘   = ‘z=>y‘ andThen ‘y=>x‘`

Arrows versus monads

- arrows generalize *functions*
- *composition* based, *pointfree* functional programming
- `val ‘z=>x‘   = ‘z=>y‘ andThen ‘y=>x‘`
- `val ‘z>-->x‘ = ‘z>-->y‘ >-->  ‘y>-->z‘`

Arrows versus monads

Arrows versus monads

- monads generalize *expressions*

Arrows versus monads

- monads generalize *expressions*
- *binding* and *result* based, *pointful* functional programming

Arrows versus monads

- monads generalize *expressions*
- *binding* and *result* based, *pointful* functional programming
- `{ val z = ez ; { val y = ey ; ex(z,y) } }`

Arrows versus monads

- monads generalize *expressions*
- *binding* and *result* based, *pointful* functional programming
- `{ val z = ez ; { val y = ey ; ex(z,y) } }`
- `mz bind { z => my bind { y => mx(z,y) } }`

Arrows versus monads

- monads generalize *expressions*
- *binding* and *result* based, *pointful* functional programming
- `{ val z = ez ; { val y = ey ; ex(z,y) } }`
- `mz bind { z => my bind { y => mx(z,y) } }`
- `mz bind { z => my bind { y => result(ex(z,y)) } }`

Arrows versus monads (kleisli arrows)

Arrows versus monads (kleisli arrows)

- `val function:  Z => Y =  z => ey(x)`

Arrows versus monads (kleisli arrows)

- `val function:  Z => Y =  z => ey(x)`
    - expression is used to define function

Arrows versus monads (kleisli arrows)

- `val function:  Z => Y =  z => ey(x)`
  - expression is used to define function
- `val kleisliArrow:  Z => M[Y] =  z => my(x)`

Arrows versus monads (kleisli arrows)

- `val function:  Z => Y =  z => ey(x)`
  - expression is used to define function
- `val kleisliArrow:  Z => M[Y] =  z => my(x)`
  - monad is used to define kleisli arrow

Arrows versus monads

Arrows versus monads

- *arrows* can be programmed *pointful* (*arrow calculus*)

Arrows versus monads

- *arrows* can be programmed *pointful* (*arrow calculus*)
- *monads* can be programmed *pointfree* (*kleisli arrows*)

Power of expressions

Power of expressions

- *monads* are more *concrete* (less *abstract*) than *arrows*

Power of expressions

- *monads* are more *concrete* (less *abstract*) than *arrows*
  - *monads allow more description liberty*

Power of expressions

- *monads* are more *concrete* (less *abstract*) than *arrows*
  - *monads allow more description liberty*
  - *monads impose more implementation constraints*

Power of expressions

- *monads* are more *concrete* (less *abstract*) than *arrows*
    - *monads allow more description liberty*
    - *monads impose more implementation constraints*
- *Constraints Liberate, Liberties Constrain*

Elegance of use

Elegance of use

- *pointfree* programming is sometimes considered to be *abstruse*

Elegance of use

- *pointfree* programming is sometimes considered to be *abstruse*
- `Dotty` comes to the rescue

Elegance of use

- *pointfree* programming is sometimes considered to be *abstruse*
- `Dotty` comes to the rescue
    - `Dotty` is a `Sca`lable `la`nguage

Elegance of use

- *pointfree* programming is sometimes considered to be *abstruse*
- `Dotty` comes to the rescue
  - `Dotty` is a `Sca`lable `la`nguage
  - `Dotty` *library based* language extensions are *type safe*

Elegance of use

- *pointfree* programming is sometimes considered to be *abstruse*
- `Dotty` comes to the rescue
    - `Dotty` is a `Sca`lable `la`nguage
    - `Dotty` *library based* language extensions are *type safe*
- `PDBP` comes with a *program description DSL*

Program Description DSL

```
val factorial: BigInt >--> BigInt =
  `if`(isZero) {
    one
  } `else` {
    `let` {
      subtractOne >-->
        factorial
    } `in` {
      multiply
    }
  }
```

Computation Description DSL

```
val factorial: BigInt => C[BigInt] = { z =>
  isZero(z) bind { b =>
    if (b) {
      one(z)
    } else {
      subtractOne(z) bind { y =>
        factorial(y) bind { x =>
          multiply((y, x))
        }
      }
    }
  }
}
```

Uh! Oh!

```
val factorial: BigInt => C[BigInt] = { z =>
  isZero(z) bind { b =>
    if (b) {
      one(z)
    } else {
      subtractOne(z) bind { y =>
        factorial(y) bind { x =>
          multiply((z, x))
        }
      }
    }
  }
}
```

PDBP's choice

PDBP's choice

- the PDBP libary goes for

PDBP's choice

- the PDBP libary goes for
    - private[pdbp] *pointful monad API*
      provides *power of expression* for *library* developers

PDBP's choice

- the PDBP libary goes for
  - `private[pdbp]` *pointful monad API*
    provides *power of expression* for *library* developers
  - `public` *pointfree arrow API*
    provides *elegance of use* for *application* developers

PDBP's choice

- the PDBP libary goes for
  - `private[pdbp]` *pointful monad API*
    provides *power of expression* for *library* developers
  - `public` *pointfree arrow API*
    provides *elegance of use* for *application* developers
- the PDBP can live with

PDBP's choice

Liskov Substitution Principle

- *impose less*
- *provide more*

Internet Robustness Principle

Internet Robustness Principle

- *be liberal in what you receive*

Internet Robustness Principle

- *be liberal in what you receive*
- *be generous in what you send*

PDBP library details

Program

```
trait Program[>-->[- _, + _]]
    extends Function[>-->]
    with Composition[>-->]
    with Construction[>-->]
    with Condition[>-->]

    with Aggregation[>-->]
```

Program

```
trait Program[>-->[- _, + _]]
    extends Function[>-->]
    with Composition[>-->]
    with Construction[>-->]
    with Condition[>-->]

    with Aggregation[>-->]
```

- `trait`'s correspond to `FP` *forms*

`Function`

Function

-
  ```
  val `z>-->y` = function(`z=>y`)
  ```

Function

- `val ‘z>-->y‘ = function(‘z=>y‘)`
- *pure functions* are *atomic programs*

Function

- `val ‘z>-->y‘ = function(‘z=>y‘)`
- *pure functions* are *atomic programs*
  - up to you to define *granularity*

Composition

Composition

-
  ```
  val ‘z>-->x‘ = ‘z>-->y‘ >--> ‘y>-->x‘
  ```

Construction

Construction

- `val ‘z>-->y&&x‘ = ‘z>-->y‘ & ‘z>-->x‘`

Construction

- `val ‘z>-->y&&x‘ = ‘z>-->y‘ & ‘z>-->x‘`
- `val ‘z&&y>-->x&&w‘ = ‘z>-->x‘ && ‘y>-->w‘`

Construction

-
  ```
  val ‘z>-->y&&x‘ = ‘z>-->y‘ & ‘z>-->x‘
  ```

-
  ```
  val ‘z&&y>-->x&&w‘ = ‘z>-->x‘ && ‘y>-->w‘
  ```

-
  ```
  val ‘z>-->x‘ =
    ‘let‘ ‘z>-->y‘
    ‘in‘ ‘z&&y>-->x‘
  ```

Condition

Condition

-
  ```
  val ‘y||x>-->z‘ = ‘y>-->z‘ | ‘x>-->z‘
  ```

Condition

- `val ‘y||x>-->z‘ = ‘y>-->z‘ | ‘x>-->z‘`
- `val ‘x||w>-->z||y‘ = ‘x>-->z‘ || ‘w>-->y‘`

Condition

-
  ```
  val ‘y||x>-->z‘ = ‘y>-->z‘ | ‘x>-->z‘
  ```

-
  ```
  val ‘x||w>-->z||y‘ = ‘x>-->z‘ || ‘w>-->y‘
  ```

-
  ```
  val ‘y>-->z‘ =
    ‘if‘(‘y>-->b‘) ‘y>-t->z‘
    ‘else‘ ‘y>-f->z‘
  ```

Computation

```
private[pdbp] trait Computation[C[+ _]]
    extends Resulting[C]
    with Binding[C]
    with Program[[-Z, +Y] => Z => C[Y]]

    with Lifting[C]

    with Sequencing[C]
```

Resulting

Resulting

- `val cz = result(z)`

Binding

Binding

- `val cy = cz bind { z => ‘z=>cy‘(y) }`

Binding

- `val cy = cz bind { z => ‘z=>cy‘(y) }`
- `val cy = cz bind { z => result(‘z=>y‘(y)) }`

Kleisli

Kleisli

- `type Kleisli[C[+ _]] = [-Z, + Y] => Z => C[Y]`

Kleisli

-
  ```
  type Kleisli[C[+ _]] = [-Z, + Y] => Z => C[Y]
  ```

-
  ```
  private[pdbp] trait Computation[C[+ _]]
      extends Resulting[C]
      with Binding[C]
      with Program[Kleisli[C]]

      // ...
  ```

factorial Helper Functions

```
val isZeroFunction: BigInt => Boolean = { i =>
  i == 0
}

def oneFunction[Z]: Z => BigInt = { z =>
  1
}
